Errors Detail

InvalidStateError

Occurs if the calling object is an unnamed Element.

InvalidArgumentError

Occurs if the argument passed is either empty in case of `std::string` or unnamed in case of `html::Element`.

InvalidModificationError

Occurs if you try to convert named Element to unnamed Element or if you pass the same object as a parameter to functions like `append_child()`, `remove_child()`, ..etc.

InvalidElementError

Occurs if you try to pass an object which has incorrect ancestor/ parent for the operation.

NotFoundError

Occurs if the object or the property is not found.

DataCloneError

Occurs if you try to clone an unnamed Element.

TypeMismatchError

Occurs if you pass a named Element as an argument to the `clone ()` function where it expects an unnamed element.
